

SafeAnet - Unipalm's Managed SofaWare Service

Unipalm's SafeAnet suite of services provide easy-to-use, stateful firewall protection using SofaWare technology from Check Point™. Offering more superior protection than NAT or packet filter firewalls, the services have the additional benefits of **anti-virus, web content filtering** and **advanced replacement support options**.

The services have been developed to suit both **home workers** and **small businesses**, offering them a cost-effective way of using Check Point's best of breed firewall.

The Check Point firewall technology used in this service supports more than 150 pre-defined applications, services and protocols out of the box. The SafeAnet service is easy to install as it is delivered on a Check Point Safe@ appliance with a pre-set security policy.

The standard service, SafeAnet Lite, comes with secure email reporting and management to allow the user to view events and attacks that have been prevented by the managed SafeAnet solution. The add-on anti-virus, URL filtering and parental control options are also available with the standard service to provide an 'all in one' security appliance.

SafeAnet services can facilitate cost-effective remote access and site-to-site data communications using Check Point's FireWall-1/VPN-1™ technology, enabling travelling employees and those in other offices secure access to network resources, such as email.

Why sell SafeAnet?

- Increases margin
- Offers recurring revenue
- Improves customer retention
- Opens up the SMB market to security services
- Does not require investment in infrastructure or technical resources

Why do your customers need SafeAnet?

- Uses world leading security technology to provide protection from threats
